## **EXPERIMENTAL**

### **Specific steaming steps of samples (taking PG as an example):**

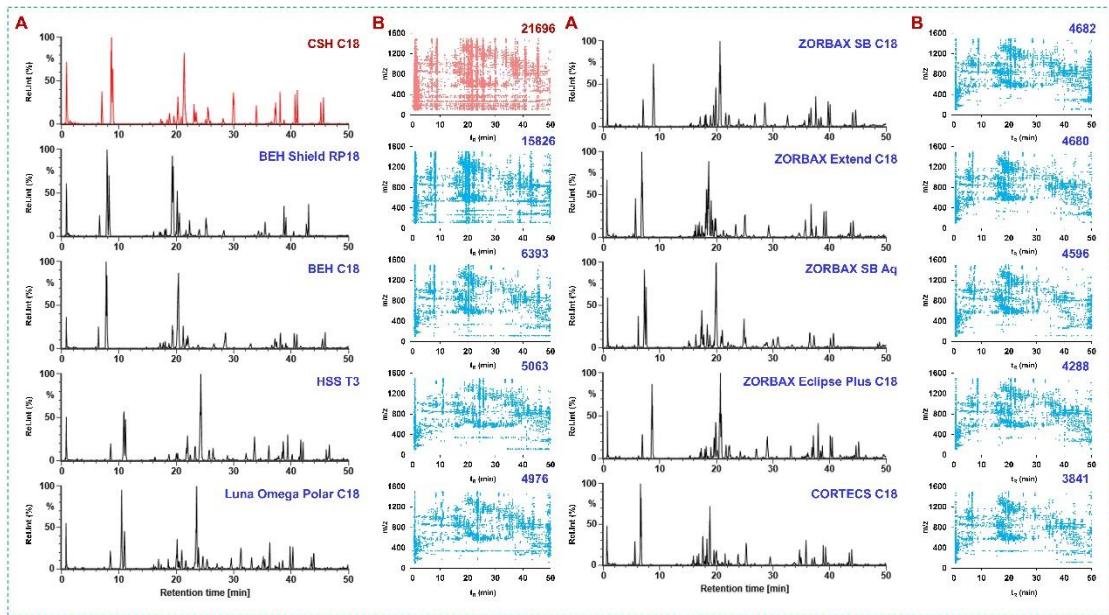

The specific evaporation steps of the sample were as follows: 1) washing: wash the soil and impurities on the surface of fresh ginseng with tap water and brush gently; 2) packing: washed ginseng medicinal materials wrapped in gauze into different small packages, 2/package, a total of 6 packages; 3) steaming: the packaged samples were placed in a pan with a caged drawer cloth, the temperature was set at 100°C, and the time was counted after water boiling. After steaming for 1 h, 2 h, 4 h, 6 h, 8 h, and 10 h, a package of PG was carefully removed; 4) drying: the steamed samples were taken out and dried in an oven at 60°C (lasting about 96 h), the raw samples were directly placed in a 45°C oven to dry after cleaning; 5) grinding: after drying, the sample was directly crushed by a crusher, through 60 mesh sieve, screening rate > 85%. PN and PQ were processed by the same method as PG, and 35 batches of samples were obtained for each medicinal material. 35 batches (105 batches: 35 × 3) of PG, PQ, and PN powder were stored in a dry and cool place for subsequent experiments.

### **Sample preparation of DESI-MSI:**

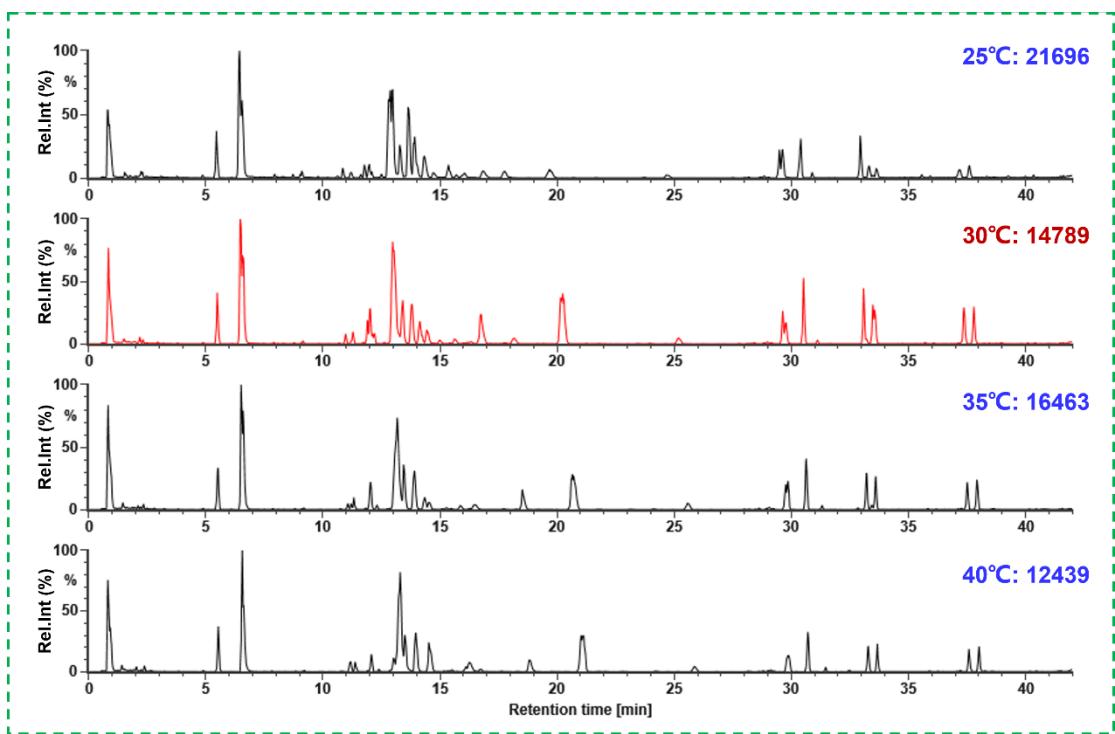

Preparation of samples for mass spectrometry imaging: 1) samples with different steaming times were cut into small sections of about 1.5 cm from roughly the same position in the middle of the main root, and frozen at -80°C for about 10 min; 2) use the embedding medium (tissue freezing medium) to fix the sample axially on the sample holder of the appropriate size matched with the cryostat microtome (Leica CM3050 S, Leica Biosystems Nussloch GmbH, Germany), and the samples were cut into tissue sections with a thickness of 40 µm at -18°C; 3) tissue sections were slowly attached to the surface of an indium tin oxide (ITO)-coated glass slide (Bruker Daltonics, Bremen, Germany), take photos and save them as “tiff” files, then place the slides in a 4°C freezer until the data is scanned.

**Table S2** Information of 10 reversed-phase chromatographic columns for the stationary phase screening.

| Number | Type                 | Specification/Manufacturer     | Separation characteristics  |
|--------|----------------------|--------------------------------|---|
| 1      | HSS T3               | 2.1×100 mm, 1.8 μm; Waters     | Polar modified octadecyl silane bonded silica gel chromatographic column, high strength silica gel particles, triple bond bonding to reduce carbon density; Enhance the retention of polar molecules and retain water-soluble compounds; Compatible with 100% water phase.  |
| 2      | CORTECS C18          | 2.1×100 mm, 1.6 μm; Waters     | Solid core particle phenyl chromatographic column can provide higher column efficiency; Realize the maximum separation with the highest column efficiency; Rapid separation, improve flux, and obtain peak shape and load for basic compounds; It can provide complementary selectivity for aromatic compounds; The bonded phase is stable without loss at low pH value.                                      |
| 3      | CSH C18              | 2.1×100 mm, 1.7 μm; Waters     | On the basis of ethylene bridged hybrid particles (BEH), a small amount of charge is controlled on its surface. It is the first-choice column for the analysis of basic drugs and peptides; The chromatographic column equilibrium is fast, the reproducibility between batches is superior, and the stability is good.   |
| 4      | BEH Shield RP18      | 2.1×100 mm, 1.7 μm; Waters     | Combined with ethyldene bridged hybrid particles, polarity embedded hydrophilic carbamate functional groups, fully capped; Enhance the retention of phenolic acid compounds; Resistant to 100% water, shielding silanol group, so that the peak shape of alkaline compounds is good; Offer different selectivity from C18.  |
| 5      | BEH C18              | 2.1×100 mm, 1.7 μm; Waters     | Ethylene bridged hybrid particle bonding C18, triple bond bonding; End groups seal the tail to ensure the peak shape of basic compounds, which is suitable for various analytes; Wide pH tolerance range.   |
| 6      | Luna Omega Polar C18 | 2.1×100 mm, 1.6 μm; Phenomenex | It is a unique modified C18, which eliminates micropores on the surface of silica gel by heat treatment on the basis of traditional fully porous silica gel, and then adds polar groups on the surface of silica gel, which has 100% water phase stability, provides a choice for the balance retention of polar and hydrophobic compounds, and is suitable for the analysis of polar and nonpolar compounds. |
| 7      | Zorbax Extend C18    | 2.1×100 mm, 1.8 μm; Agilent    | Spherical porous silica gel particles; Adopt unique double coordination C18-C1 bonding and double end-capping technology to ensure the stability of high pH separation; Improve the retention behavior, resolution and peak shape of basic compounds; Silica gel base, high column efficiency, higher column  |

| Number | Type                    | Specification/Manufacturer  | Separation characteristics  |
|--------|-------------------------|-----------------------------|---|
| 8      | Zorbax Eclipse Plus C18 | 2.1×100 mm, 1.8 μm; Agilent | efficiency and better peak shape than polymer matrix chromatography column.<br>Spherical fully porous silica gel-based particles with double-terminated octadecylsilane chemically bonded phase; It can be used for the analysis of acid and neutral samples, especially for the separation of basic compounds with poor peak shape on other chromatographic columns. |
| 9      | Zorbax SB-Aq            | 2.1×100 mm, 1.8 μm; Agilent | Spherical fully porous silica gel particles with polarity enhanced octadecyl silica gel chemically bonded phase with three-dimensional protecting groups on the side groups. It can be used for highly acidic mobile phase and highly polar samples, and can be compatible with 100% pure water mobile phase.   |
| 10     | Zorbax SB-C18           | 2.1×100 mm, 1.8 μm; Agilent | The StableBond packing used in this column is uncapped, uses unique, monofunctional silanes, has large diisobutyl side chain groups, is compatible with all common mobile phases, and is allowed to be used at high temperature and low pH value conditions.  |

**Table S3** Information of 10 ginsenoside indicators used for optimizing the ion-source parameters of Vion IM-QTOF.

**Table S14** Optimization of the freezing temperature and time in the DESI-MSI experiments.

| Temperature                                 | Time   | Results   |
|---|--------|---|
| <b>Optimization of freezing temperature</b> |        |   |
| -20°C                                       | 10 min | Insufficient hardness and difficulty in slicing   |
| -80°C                                       |        | Better hardness and easier slicing                |
| <b>Optimization of freezing time</b>        |        |   |
| -80°C                                       | 1 min  | Insufficient hardness and wrinkled tissue slice   |
|   | 2 min  | Insufficient hardness and wrinkled tissue slice   |
|   | 5 min  | Insufficient hardness and wrinkled tissue slice   |
|   | 8 min  | Insufficient hardness and wrinkled tissue slice   |
|   | 10 min | Incomplete tissue slice                           |
|   | 15 min | complete tissue slice and easier slicing          |
|   | 20 min | Incomplete tissue slice and difficulty in slicing |
